PRESENTACIÓN FINAL (Cinemática Diferencial de Piernas)

Jesús Alejandro Gómez Bautista | A01736171

PARTE I

EJERCICIO 1 ------

Obtener la matriz de transformación homogénea global T, empleando variables simbólicas de los siguientes sistemas la cual relacione la posición y orientación del extremo del robot respecto a su sistema de referencia fijo (la base). Simulando cada una de las transformaciones desde la trama absoluta hasta la trama final.

PARTE II.

CINEMÁTICA DIFERENCIAL SIMBÓLICA (Pierna)

- 1. **Desarrollar** el modelo de **cinemática diferencial simbólica** para cada uno de los sistemas descritos anteriormente y obtener los vectores de la **velocidad angular y velocidad lineal** aplicando variables simbólicas para su análisis en cada caso.
- mplementar el código requerido para generar el cálculo de las matrices homogéneas simbólicas (H1, H2, H3, etc.), la matriz de transformación simbólica (T) y los vectores de velocidades simbólicas (v, w) de cada sistema.

```
